Description

KOBOLD level sensors/transmitters are used for continuous level indication and monitoring of all types of liquids. It is based on the float principle with magnetic transmission in a 3-wire potentiometer circuit.

Its simple design with only one moving part, the float, makes the transmitter particularly reliable.

A range of sensors in different materials and designs, and with different connections, are available for measured-value acquisition.

Specific designs are available.

Function principle

A float with a magnetic system switch small reed contacts through the guide tube.

The reed switches with resistances form a measuring chain that generates a voltage proportional to the height of the level. This sensing technique is similar to the operation of a sliding contact on a resistance potentiometer.

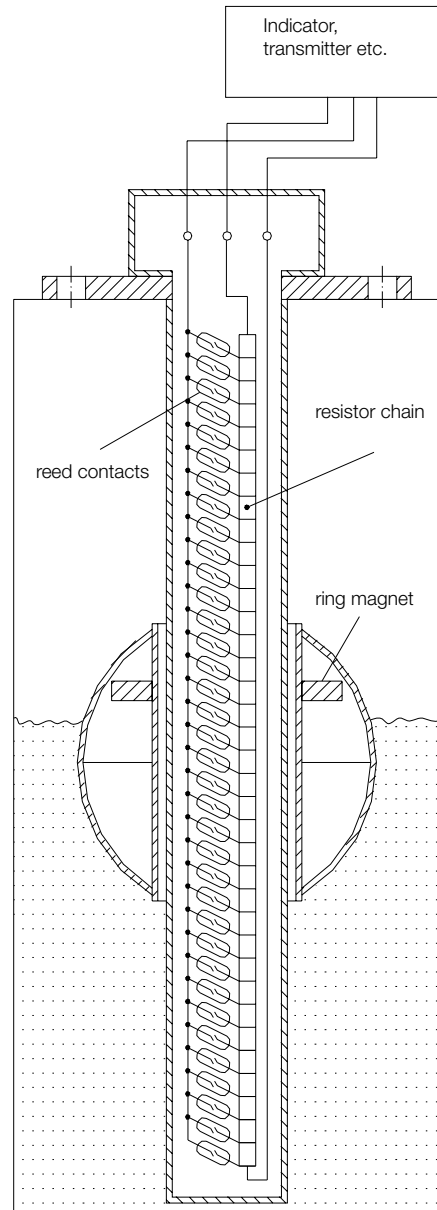

The voltage sampled from the chain is transferred to a transmitter (option) which output a current signal proportional to the liquid level or, depending on the design, also allows limit values to be monitored.

The transmitter can be mounted in the terminal box or as an external instrument. Local analogue or digital indication can also be provided.

Applications

- Waste water and clarification plants
- Feed and batching tanks
- Chemical tanks
- Manufacturing industry
- Power plants
- Pharmaceutical industry
- Beverage and food industry
